

ABSTRACT

An image processing apparatus includes a read and analysis unit that analyzes print setting items recorded by a printer and stored in a memory card, and a generation unit that generates additional data relating to print settings required upon printing by the printer based on the print setting items analyzed. The image processing apparatus reduces the user's burden of manipulating print setting items for each printer, and avoids an incident in which print setting items that cannot be set by a printer that is to output image data are set.
